QueueSmart TicketManager

Assignment 3: Backend Development & API Implementation

TEMPLATE - NOT SUBMISSION READY

Group: [fill] Date: [fill]
Final tested GitHub commit: [fill]

1. GitHub repository link (5 points)

https://github.com/saniyacole5/queuesmart-ticketmaster

Backend: /backend Tests: /backend/test
Code and tests pushed: [verify date/status]
Final test command and result: [fill]
Final measured coverage and scope: [fill lines / branches / functions]
Frontend integration, lint and build evidence: [fill]

2. Backend technologies (2 points)

Proposed language/framework: JavaScript, Node.js 24, Express 5. Node.js follows the A1 backend plan and shares a language with the React frontend. Express provides REST routing, JSON parsing, authentication middleware and error handling.

Separate authentication, service, queue, wait-time, notification and history modules support the QueueSmart architecture. REST responses supply the A2 React/Vite screens. Node's built-in test runner exercises business logic and validation; V8 reports coverage.

A3 uses in-memory arrays and maps. MySQL is planned for A4 but is not implemented because A3 explicitly defers database persistence. State resets on backend restart. Notifications are returned to the frontend without real email/SMS.

[Revise these technology statements if your final implementation differs. Fill only actual test and coverage results.]

3. Team contributions (3 points)

Names are from A1. Fill actual completed work and actual discussion notes, supported by member-authored commits and PRs. Proposed ownership is not proof of contribution.

Group member	What is your contribution?	Discussion notes
Ayman Almasree	[Actual code, tests and frontend integration] [Commit / PR links]	[Actual discussion, decision and review notes]
Saniya Cole	[Actual code, tests and frontend integration] [Commit / PR links]	[Actual discussion, decision and review notes]
Isabel Buentello	[Actual code, tests and frontend integration] [Commit / PR links]	[Actual discussion, decision and review notes]
Israel Tolentino	[Actual code, tests and frontend integration] [Commit / PR links]	[Actual discussion, decision and review notes]

Final review: verify meaningful, comparable contributions by all four members; confirm backend and tests are pushed and executable. TAs review GitHub commit history.

Canvas: one final Word or PDF document, one submission per group. Do not submit code or this scaffolding ZIP to Canvas. Use the companion Markdown template as editable source.
